

## Question 17.3

**Topic:** Missing F-factor Data

**Question:** If an Appendix D unit is burning multiple fuels and the owner/operator has chosen to determine NO<sub>x</sub> emissions based on a prorated F-factor calculated from the heat input from each fuel, how should the NO<sub>x</sub> emissions be determined for an hour in which heat input data for one of the fuels are missing?

**Answer:** Use the F-factor from the fuel with the highest F-factor that is burned in a given hour.

**References:** Appendix D, Section 2.4; Appendix F, Section 3

**History:** First published in July 1995, Update #6; revised in October 1999 Revised Manual; revised in 2013 Manual
