

## **Question 19.7**

**Topic:** Validation of RM Backup Data

**Question:** What criteria are used to validate a test run when a Part 75 RM backup gas monitoring system is used?

**Answer:** For dry-extractive monitoring systems, the run is validated if the RM backup system passes the post-run system bias check. For dilution-type RM backup systems, a run is validated if the CEMS passes the post-run system calibration error check. Whenever a RM backup monitor test run is invalidated, the Part 75 missing data procedures must be applied to fill in data for each hour of the test run.
